

HOW TO TEST MATERIAL FOR ASBESTOS

PREPARATION

For bonded material including vinyl floor tiles and suspected non-friable asbestos:

- Lay down a plastic drop sheet to catch any loose material that may fall off while sampling.
- Turn off any fans or air conditioning if you're inside. If outside, then sample on a non-windy day.
- Put on Class P2 respirator mask and wear a pair of disposable coveralls.

SAMPLING PROCEDURE (NON-FRIABLE MATERIAL)

- Dampen down the area with the water spray bottle.
- Remove a representative sample (30mm x 30mm) of material with clean pliers. Select a sample from a corner edge or along an existing hole, crack, or behind power point. If the edge is exposed, apply PVA glue to seal any fibres.
- Place sample into a resealable plastic bag, and double bag.
- Label with the Date, Site Details, Sample Number and Sample Location.
- Complete the Chain of Custody Form (see next page) and post in a plastic or padded sealed envelope. Costs are \$80 per sample, GST Inclusive.

A NATA laboratory analysis report will be emailed or mailed to you with results indicating the type of fibres present including any asbestos (eg. Chrysotile, Amosite or Crocidolite).

Note: If friable asbestos is suspected, please contact us, as it is legislation that a licenced asbestos assessor samples the material. Never sample electrical Bakelite backing boards due to the risk of electrocution, assume according to the age of the board that it may contain asbestos material. If you are located in the ACT, legislation states that all Asbestos Samples must be obtained by a Licensed Asbestos Assessor.
